BURNETT'S Formula No. 1 LAWN GRASS SEED

WHY THE MYSTERY

Why Shouldn't You Know What Is in a Good Lawn Grass Seed Mixture Before You Buy It? You Should Know What You Are Buying

FACT 1. The more certified Illahee Creeping Red Fescue and Kentucky Blue Grass a mixture contains, the better the mixture.

FACT 2. Both are Perennials and live indefinitely. However, they require two or three years to reach full maturity.

FACT 3. Meanwhile they need quick-growing Red Top and Rye Grass as nurse crops to shade them in their early growth.

FACT 4. Your first year's lawn is mostly Red Top and Rye Grass.

FACT 5. After a few years, Illahee Creeping Red Fescue and Kentucky Blue Grass will be at their best; they form the permanent lawn.

BURNETT-SEEDSMEN'S "FORMULA No. 1"

Is THE No. 1 Lawn Grass Seed Mixture

because it is made up of 25% Illahee Red Fescue, 25% Kentucky Blue, 25% Red Top, 25% Rye Grass.

ALL-AMERICA SELECTIONS

1950

ALL the "All America Selections" introduced since 1933 are grouped here. They represent the newest developments in flowers, the latest fashions. In making these your choice, you are assured of having selected the best for your garden.

HERE IS HOW THE "ALL AMERICA SELECTIONS" ARE MADE

"ALL AMERICA SELECTIONS" are the choice of the Nation's leading horticultural judges, as being the most worthy new varieties introduced each year. They include species from around the World, imported and planted in twelve different localities in the United States, from whence they are judged. Their recommendations are authentic and dependable; your safeguard against ambiguous creations or claims. Novelties within our garden walls intrigue us, for they tax our keenest anxiety in expectation of unrevealed new beauties—and we pride ourselves of keeping in with the modern touch.

HOW IT WORKS—

13 Card Slides are arranged on each side, North, East, South and West. Expose only your cards and bid. Partially move back "bid" slides (each side has one) to check your bid's correctness and the bid responses of partner and opponents. Keep bidding until three pass and contract has been established. (You are always declarer, never dummy). You play West's first lead by moving back West's No. 1 slide. Now expose all of dummy's cards. You play to West's lead by covering one of dummy's cards. In so doing you expose a number. You have played correctly, if that number corresponds to the number of the trick played. East's play is also numbered and played automatically. Your opponents play a flawless game. You play from your hand just as you did from dummy.

Why the Mystery?

Why Shouldn't You Know What Is in a Good Lawn Grass Seed Mixture Before You Buy It You Should Know What You Are Buying

- FACT 1** The more Certified Illahee Creeping Fescue and Kentucky Blue Grass a mixture contains, the better the mixture.
- FACT 2** Both are Perennials and live indefinitely. However, they require two or three years to reach full maturity.
- FACT 3** Meanwhile they need quick-growing Red-Top and Rye Grass as nurse crops to shade them in their early growth.
- FACT 4** Your first year's lawn is mostly Red Top and Rye Grass.
- FACT 5** After a few years, Certified Illahee Creeping Fescue and Kentucky Blue Grass will be at their best; they form the permanent lawn.

About Your Lawn

SOW The Best GRASS SEED MIXTURES ON The Best SOILS Only

"The better the Lawn Grass Seed Mixture used, the better the lawn produced." That is true only if you bear this in mind, "The better the soil planted, the better the lawn produced." One without the other means a waste of time and money. Both requirements are necessary for a **permanent** lawn.

WHAT IS MEANT BY BETTER SOILS?

The deeper the top-soil (friable loam, a handful crumbles when palm is opened) the better the soil. The deeper the top-soil, the deeper will grass roots penetrate. The deeper the grass roots go into the ground, the better the chances of grass surviving Summer droughts. Clay soil or hard pan bakes after a rain preventing grass roots from breathing. Sandy soil is so porous, rain and moisture leach rapidly out of the ground. These two types of soil must be replaced or converted into loam, the deeper the better.

HOW TO CONVERT CLAY OR SANDY SOILS?

It takes time. The more patient you are, the more successful you will be. If you forego an entire growing season by planting a succession of cover crops you will not regret it. Rye, Winter Vetch, Soy Beans, Cow Peas and Crimson Clover are excellent cover crops. All except clover sow at the rate of 5 lbs. per 1000 sq. ft. clover, but 1 lb. per 1000. Rye seed produces an abundance of greens. The other four being legumes bring nitrogen into the soil by extracting it from the air. Start with Rye seed. Sow broadcast. Rake lightly and cover an inch or so of Peat Moss. After a few months when growth has reached a height of one foot or more, turn under. Be sure and bury the stalks as well as the roots. Spread Agrico Lawn fertilizer 25 lbs. to every 1000 sq. ft. Now sow any one of the other four crops, rake, cover with Peat Moss. When high enough turn under, fertilize. Repeat this process as often as desired. Remember the more crops planted and buried the deeper the top-soil becomes. You can stop the plantings when you reach either of the two best lawn seeding periods September or April. For Fall planting use either Rye or Winter Vetch and spade under in the Spring. Only these two will winter over.

SALEM FERTILIZER SPREADER

Only these two will winter over.

BEWARE IN BUYING TOP-SOIL

The best top-soils sold contain innumerable weed seeds. You won't notice them until the lawn comes up. Keep in mind, the cheapest lawn grass seed mixture does not contain weed seeds of Dandelion, Crab Grasses or Plantain. Weeds get into your lawn through top-soil, manure or are blown in. If you want to buy soil improving material, purchase Peat Moss, Humus, Cow Manure, Driconure or Bovung. These materials carry the least if any weed seeds. Only a few inches of improved top soil are insufficient to maintain a permanent lawn.

FINAL PREPARATIONS OF SOIL

After turning under the last cover crop, allow a few weeks time for it to rot, and for the ground to set. Test soil for fertility deficiency by using a soil testing kit or mailing a sample to your state Agricultural Exper. Station. Add the recommended quantity and quality of fertilizer, and rake in thoroughly. Rake and roll the ground, being careful not to leave any depressions or gullies into which rain will accumulate and sour. Your last step is to rake smooth of stones and slope very slightly to allow excess rains to flow off.

SEEDING THE LAWN

(1 lb. will sow 200 sq. ft.)

Using the handle of your rake as a marking stick, divide the area into several sections. In sowing each boxed section your eyes will be confined and not wandering which makes for more thorough sowing. If you use a fertilizer and grass seed spreader, this dividing is not necessary. After the entire area has been sown, rake lightly by drawing the rake towards you. Since raking is for the purpose of making ridges into which the seed drops and soil falls on top of it, be careful to not let the teeth of the rake go too deep into the soil. To do so, you would draw the soil away in spots leaving them unseeded. To avoid this, grasp the end of handle with the right hand and the underside of the middle of the rake with the left hand. This is the best method for covering the seed. Do not scatter soil over the seed. This method makes too uneven a covering. After raking, roll the ground lightly. If a roller is unavailable, lay a plank board on lawn and step on it or use a sod tamper. Rolling or tamping the seed is important. By so doing you pack the seed into the soil, eliminating all air pockets. This makes for better germination. The last step is to water the lawn with a fine sprinkler or nozzle unless you are fortunate to have a rain fall immediately after you have completed the job.

REAL REEL

LATER CARE OF THE LAWN

When the first good growth of grass has appeared, do not cut it. Instead, roll it lightly. These grass seedlings in breaking through the ground push up the soil. Rolling repacks the soil. After a few days you can mow the lawn without danger of pulling out the grass. Any time you dig out a weed, be sure and sow a little grass seed in that spot. Keep the soil covered with grass at all times. Weeds are blown on your lawn daily by the thousands. Many of them sprout. If they cannot touch soil, they wilt away and die. There are many chemicals for killing weeds in lawns, Zotox, 2-4-D and "Tat-C-Lect". Some report success with them. Top-dress your lawn twice a year, Spring and Fall, preferably before a rain.

Terra-Lite provides perfect control of air and water for speedy, heavy root growth. Maximum seed germination. Seeds easily plucked out for transplanting.

An Ideal Mulch

Stops winter soil heaving by curbing drastic changes in soil temperatures. Prevents drying out in summer. Less watering.

Lightening Soil

Heavy, clay soil can be aerated with Terra-Lite as in no other way. Lets roots spread out, provides perfect air-moisture control for best growth. Terra-Lite gives body to sandy soils, helps them retain moisture.

Transplanting

When you plant shrubs, bushes, trees, bulbs or seedlings in your garden, a little Terra-Lite in the soil mixture assures the required air and moisture for roots . . . bigger, better plants result!

Rooting Cuttings

If you root your own cuttings you'll be amazed how quickly roots develop in Terra-Lite. Masses of hair roots spring forth, making strong healthy cuttings that take hold quickly when transplanted.

New Lawns

Greener, healthier Terra-Lite lawns make friends, for Terra-Lite's ability to store and control air and moisture means no scorching, less watering.

Storing Bulbs

Bulbs stored in Terra-Lite will not rot. Insulates against abnormal changes in temperature—keeps bulbs firm and plump.

Yes, you'll find many ways to use Terra-Lite in your gardening chores, "all thru the year." You see, Terra-Lite vermiculite is a form of expanded mica that has unusual ability to hold many times its weight in water—yet, Terra-Lite never shuts out air that plants so need. The power to hold and release air and water as needed for healthy growth is what makes it such a help in your gardening.

MAKE ROOTED CUTTINGS of Those Rare "HARD-TO-ROOT" Plants

By Using Hormodin Powder

Hormodin Powder makes it possible to propagate practically all varieties of plants from cuttings. Hormodin Powder contains the hormone-like plant growth substance (Indolebutyric Acid) that stimulates rapid root growth on cuttings.

Since different plants require different treatment, Hormodin Powder has been developed in three strengths, paralleling the range of hormones in nature.

Asters ^a (Wilt Resistant)

Need no introduction, but what is **Wilt Resistant Aster Seed**? It's a strain of seed produced from plants that were grown in heavily wilt-infested soil. It is reasonable to infer that if a strain was able to grow to full maturity and bear seed, it's genera or offspring must likewise be immune to wilt. Don't take chances, sow **Wilt Resistant Strain Asters** wherever possible.

Asters prefer rich sandy or loamy soil. Use well rotted manure or phosphate fertilizer. Cultivate and water regularly. Sow seeds six weeks before intended transplanting; water immediately after. Set tall varieties 18 in. apart, medium sorts 12 in. apart, dwarf types 9 in. apart.

Delphinium Seeds

VETTERLE & REINELT'S (PACIFIC HYBRIDS) were awarded a gold medal at the 1939 and 1940 Oakland Spring Garden Shows, the annual flower events of the Pacific Coast. Could not compete in 1941.

V. & R. Delphiniums are classed with the top-ranking strains of the world. Praises of them are just as numerous and sincere from the professionals as from the amateurs. **Our Seed Supplied by Vetterle & Reinelt.**

HAND CROSS-POLLINATED seed is V. & R.'s best strain. This stock possesses the most desirable characteristics, qualities which are intensified to the greatest degree possible. The percentage of **show specimens** from this hand cross pollinated seed is the highest obtainable.

SELF-POLLINATED seed is collected from outstanding plants and will produce plants fairly uniform in color and type. For exhibition plants, however, sow the hand cross pollinated seed.

CROSS-POLLINATED SEED—each: Pkt. \$2.50, Collection 5 vars. \$10.00.
½ pkt. \$1.25, Collection 5 vars. \$5.00.

Blue Bird Series (new 1941). At last a true blue Delphinium; clearest medium blue with white bee. Besides coming true to color they carry well rounded 2½ in. flowers; long graceful spikes. A new standard in blues of today.

BLUEJAY. Strikingly clear true blue, medium to dark, intense and alive with dark contrasting bee.

CAMELIARD SERIES (new 1940). Pure lavender self with white bee. Perfectly formed flowers; well balanced spike.

King Arthur Series. Rich royal purple with a velvety texture and large white bee. One of the most brilliant.

FREE: Delphinium Cultural Leaflet by Vetterle & Reinelt, explaining how to get best results with Delphiniums (Mailed with each packet of V. & R. seed).

LANCELOT. Clear lilac self with white bees, rare color; most beautiful. It has well balanced spike; large flowers.

PERCIVAL Series. A companion to the white delphinium Galahad, of equally good quality; the bee here however is a contrasting black; a striking beauty. Flowers well spaced on long tapering spikes.

ROUND TABLE SERIES (new 1940, July delivery). New color developments from over 300 crosses possessing immense size spikes.

Here is an asparagus that actually comes into bearing **ONE YEAR EARLIER** than any other variety. An exceptionally strong, vigorous producer. Some say it produces twice the crop of ordinary asparagus. The stalks are like Martha Washington in appearance, large and green. Just imagine, only 6 to 8 stalks needed to make a pound. Its flavor is unusually mild and liked by all. Paradise is rust-resistant. Seed sown in Spring will bear asparagus for picking 2 years later. Fifty Day Sprouting Broccoli

Broccoli

Easier to grow than Cauliflower.

No other table green has captured the appetites of a Nation more than Broccoli, and why not? Its delicious fine flavor is appetizingly pleasing even to children, yet rich in iron; more easily digested and is of easier culture. Set plants 18 in. apart in rows and 24 in. between; when the center flowers form, cut with about 7 in. of stem; this will be followed later by several smaller heads. No fuss in tying up, like in cauliflower.

Fifty Day Sprouting Calabrese

Just think of it—you can pick "Fifty Day Sprouting Broccoli" in 40 to 50 days after transplanting, in certain localities; 50 to 60 in others. It is unquestionably the earliest in cultivation, yet may be used for late sowing (up to July). The heads are large, deep green, the texture extra fine and tender, the taste superb. It is a sprouting type, producing many lateral heads after the center head is cut; being a great heat resister, it will not burst into flower. Seeds of this superlative variety were imported direct from the grower in Italy.

Lettuce

Although lettuce is easy to grow, it should be grown quickly in rich moist soil to be crisp and tender. Sow in a hot-bed in Feb.-March, transplanting to open ground 12 in. to 15 in. apart, in rows 18 in. apart. Make successive sowings to August. Cultivate and water thoroughly. Remember lettuce does best during cool weather.

"EASY-TO-HEAD"

SENSATIONAL NEW LETTUCES

They Head in Hot Weather

Pennlake. (B.M., A.A.S., '49). A smaller heading, more refined Great Lakes, without the prominent mid-ribs; remarkably resistant to heat and tip-burn. The ideal family sized head.

Pkt. 25c; ½ oz. 60c; oz. \$1.00

Premier Great Lakes. (B.M., A.A.S., '49). Earlier, larger, solid headed Great Lakes, that is more resistant to tip burn; attractive foliage.
